

engraflexx EC - various special versions

It may be necessary to use shorter tool versions or versions with an integrated tool holder, particular during operation on smaller machines with extremely tight space situations. We can therefore also supply the engraflexx EC tools in different customised versions, some of which are even available from stock.

Samples of the small version with cylindrical shank shaft, versions with an integrated HSK40 tool shank for use in machining centres, and a driven tool version VDI40 for lathes can be found below.
